

Team Members:

Taylor Pearce
Wendy Zhang Huang

Project Option:

For this project we chose Option B: Lighting & Mood Scene.

Lighting Diagram:

Post Processing Settings:

Scene before post processing effects:

DayTime post processing - used warmer color tones, lower vignette and softer bloom to create a cozy environment with natural sunlight.

Nighttime post processing - used cooler color tones, stronger vignette, and darker exposure to make the environment darker and atmospheric.

Reflections:

Taylor - For this assignment I contributed by importing the assets, placing the assets, implementing the character controller and camera, adding the collision for the room, and also implementing the day/night cycle for our room. Before this assignment I knew virtually nothing about lighting within Unity. I had only ever used the basic single light that projects start with but never anything more complex. This project helped me to immensely expand my knowledge of lighting and how it works when in an environment like this. I also learned a lot about asset implementation and how to make it all look neat from the player perspective. Overall I really enjoyed working on this project and it makes me excited to work more with lighting in the future.

Wendy - For this assignment I contributed by implementing the post processing effects, UI for day/night cycle, lighting and placing some assets. Working in this environment helped me learn how lighting and post processing can completely change the mood of the scene. I mostly experimented with the post processing effects and

played around with Bloom, Color Adjustments, White Balance and Vignette to make the scene feel more immersive. Through this process, I gained a better understanding of how lighting and visual effects work together to improve the overall appearance of a 3D environment.
